EXAMINER

SAEED, USMAAN

ART UNIT

PAPER NUMBER

2166

DATE MAILED: 10/03/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

<b>Office Action Summary</b>	<b>Application No.</b> 10/643,644	<b>Applicant(s)</b> COCHRANE ET AL.	
	<b>Examiner</b> Usmaan Saeed	<b>Art Unit</b> 2166	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

#### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

- 1) ☒ Responsive to communication(s) filed on 27 June 2006.
- 2a) ☒ This action is **FINAL**.                      2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

- 4) ☒ Claim(s) 1-4, 8-11, 15-17 and 21-24 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-4, 8-11, 15-17, and 21-24 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## **DETAILED ACTION**

### ***Response to Amendment***

1. Receipt of Applicant's Amendment, filed on 6/27/2006 is acknowledged. Claims 5-7, 12-14, 18-20, and 25-27 have been canceled and claims 1-4, 8-11, 15-17, and 21-24 are pending in this application.

The request for change of inventorship is defective because an amendment cannot remove an inventor from an application. See corrections to inventorship practice, MPEP 201.03 and 37 CFR 1.48 (b).

The affidavit 1.132 filed on 6/27/2006 is ineffective because the applicant has not fulfilled the requirements for attributing the reference to the applicants. In accordance with MPEP 716.10 the applicant must provide evidence that establishes that the subject matter relied on in the reference was derived from the applicant and invented by the applicant. The applicant's declaration must assert invention and facts establishing derivation.

It is also unclear what contributions Themistoklis Palpanas provided to the article, particularly since he did not contribute to the invention. Therefore the reference still qualifies as a prior art under 102 (a).

### ***Specification***

2. The amended specification was received on 6/27/2006 and is acceptable.

***Claim Rejections - 35 USC § 102***

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.

Claims 1-2, 4, 8-9, 11, 15-16, 21-22 and 24 are rejected under 35 U.S.C. 102(a) as being anticipated by **Palpanas et al. (Palpanas hereinafter)** (NPL “Incremental Maintenance for Non-Distributive Aggregate Functions, Proceedings of the 28th VLDB conference, Hong Kong, China, 2002, 12 pages”).

With respect to claim 1, **Palpanas** teaches “**a method of incrementally maintaining algebraic functions in automatic summary tables (ASTs) of at least one relational database, said method comprising**” as the incremental infrastructure with work areas to support the maintenance of functions that are algebraic (**Palpanas** Abstract). Materialized views, or Automatic Summary Tables (ASTs), are increasingly being used to facilitate the analysis of the large amounts of data being collected in relational databases (**Palpanas** Introduction).

**“associating a work area with each algebraic function in each AST”** as a function is algebraic for an operation if the new result of the function, as a result of the operation, can be computed using some small, constant size storage (work area) that accompanies the existing value of the aggregate (**Palpanas 1.1 Classes of Aggregate Functions**).

**“populating variables within each work area for each algebraic function when each AST is created and when each AST is updated”** as when an update is required, expressions are built in the result of the join to compute the new values of the affected aggregate functions by combining the old values from the AST with the corresponding values of the final delta (**Palpanas 2.2.2 Apply Phase Compilation**). The maintenance of algebraic functions is optimized by incrementally maintaining the information in the work area and computing the resulting aggregate function of the query from the work area. Some standard SQL functions that are algebraic are AVG, CORRELATION, COVARIANCE, the REGRESSION functions, STDDEV and VARIANCE (**Palpanas 4 Using Work Areas**). AVG and STDDEV are algebraic for INSERT and DELETE. For AVG, the work area consists of simply the COUNT (**Palpanas 1.1 Classes of Aggregate Functions**).

**“maintaining each work area by adding and subtracting to and from associated variables of each work area”** as the system can compute the new value of the aggregate function from its old value and the changes themselves, for both insertions and deletions (**Palpanas 1.1 Classes of Aggregate Functions**). Examiner interprets insert as adding and delete as subtracting. **“when associated data changes**

Art Unit: 2166

**in said relational database**” as the apply phase detects that only updates are in the data flow, and consequently builds clauses that update only those aggregate functions of the AST which are affected by the changes to the underlying tables (**Palpanas 3.5 Eliminate Unnecessary Operations**).

**“computing each algebraic function”** as a function is algebraic for an operation if the new result of the function, as a result of the operation, can be computed using some small, constant size storage (work area) that accompanies the existing value of the aggregate (**Palpanas 1.1 Classes of Aggregate Functions**).

Claim 21 is essentially the same as claim 1 except it sets forth the claimed invention as a computer program, and is rejected for the same reasons as applied hereinabove.

With respect to claim 2, **Palpanas** teaches **“the method in claim 1, wherein multiple algebraic functions share the same work area”** as the work areas from each partition are then combined into a final work area, and the aggregate function is computed from the final work area. We apply the same algorithms to incrementally maintain these functions for insertions, and similar algorithms can also be used for deletions. The final work area for each of these functions must be kept in the materialized view as an additional, hidden attribute (**Palpanas 4 Using Work Areas**). The examiner interprets the final work area as shared area.

Claims 9, 16 and 22 are same as claim 2, except claim 22 sets forth the claimed invention as a computer program, and are rejected for the same reasons as applied hereinabove.

With respect to claim 4, **Palpanas** teaches “**the method in claim 1, wherein said computing process comprises recomputing said algebraic function after one or more of said variables have changed**” as only the function STDDEV (salary) will be recomputed, since the specified changes do not affect the other aggregate functions (**Palpanas** 3.5Eliminate Unnecessary Operations, Example 3). Recomputation is being done after changes made to salary.

Claims 11 and 24 are same as claim 4, except claim 24 sets forth the claimed invention as a computer program, and are rejected for the same reasons as applied hereinabove.

With respect to claim 8, **Palpanas** teaches “**a method of updating an automatic summary table (AST), wherein said AST stores derived data from multiple dynamic data tables and said AST comprises multiple algebraic functions, said method comprising**” as the incremental infrastructure with work areas to support the maintenance of functions that are algebraic (**Palpanas** Abstract). Materialized views, or Automatic Summary Tables (ASTs), are increasingly being used to facilitate the analysis of the large amounts of data being collected in relational

Art Unit: 2166

databases (**Palpanas** Introduction). The apply phase detects that only updates are in the data flow, and consequently builds clauses that update only those aggregate functions of the AST which are affected by the changes to the underlying tables (**Palpanas** 3.5 Eliminate Unnecessary Operations).

**“creating a separate work area for each algebraic function within said AST”** as queries containing the aforementioned function can be evaluated in parallel using work areas (**Palpanas** 4 Using Work Areas).

**“maintaining each work area by adding and subtracting to and from associated variables of each work area”** as the system can compute the new value of the aggregate function from its old value and the changes themselves, for both insertions and deletions (**Palpanas** 1.1 Classes of Aggregate Functions). Examiner interprets insert as adding and delete as subtracting. **“when associated data changes in said relational database”** as the apply phase detects that only updates are in the data flow, and consequently builds clauses that update only those aggregate functions of the AST which are affected by the changes to the underlying tables (**Palpanas** 3.5 Eliminate Unnecessary Operations).

**“integrating said changes into said AST by computing each algebraic function”** as all the necessary changes for the AST are computed based only on the modification to the base table (and the corresponding values in the AST) (**Palpanas** 1 Introduction).

With respect to claim 15, **Palpanas** teaches “a method of incrementally maintaining algebraic functions in automatic summary tables (ASTs) of at least one relational database, said method comprising” as the incremental infrastructure with work areas to support the maintenance of functions that are algebraic (**Palpanas** Abstract). Materialized views, or Automatic Summary Tables (ASTs), are increasingly being used to facilitate the analysis of the large amounts of data being collected in relational databases (**Palpanas** Introduction).

“associating a work area with each algebraic function in each AST” as a function is algebraic for an operation if the new result of the function, as a result of the operation, can be computed using some small, constant size storage (work area) that accompanies the existing value of the aggregate (**Palpanas** 1.1 Classes of Aggregate Functions).

“populating variables within each work area for each algebraic function when each AST is created and when each AST is updated” as when an update is required, expressions are built in the result of the join to compute the new values of the affected aggregate functions by combining the old values from the AST with the corresponding values of the final delta (**Palpanas** 2.2.2 Apply Phase Compilation). The maintenance of algebraic functions is optimized by incrementally maintaining the information in the work area and computing the resulting aggregate function of the query from the work area. Some standard SQL functions that are algebraic are AVG, CORRELATION, COVARIANCE, the REGRESSION functions, STDDEV and VARIANCE (**Palpanas** 4 Using Work Areas). AVG and STDDEV are algebraic for

INSERT and DELETE. For AVG, the work area consists of simply the COUNT (**Palpanas 1.1 Classes of Aggregate Functions**).

**“maintaining each work area by adding and subtracting to and from associated variables of each work area”** as the system can compute the new value of the aggregate function from its old value and the changes themselves, for both insertions and deletions (**Palpanas 1.1 Classes of Aggregate Functions**). Examiner interprets insert as adding and delete as subtracting. **“when associated data changes in said relational database”** as the apply phase detects that only updates are in the data flow, and consequently builds clauses that update only those aggregate functions of the AST which are affected by the changes to the underlying tables (**Palpanas 3.5 Eliminate Unnecessary Operations**).

**“recomputing said algebraic function after one or more of said variables have changed”** as only the function STDDEV (salary) will be recomputed, since the specified changes do not affect the other aggregate functions (**Palpanas 3.5 Eliminate Unnecessary Operations, Example 3**). Recomputation is being done after changes made to salary.

4. Claims 3, 10, 17 and 23 are rejected under 35 U.S.C. 103(a) as being unpatentable over **Palpanas et al.** (NPL “Incremental Maintenance for Non-Distributive Aggregate Functions, Proceedings of the 28th VLDB conference, Hong Kong, China, 2002, 12 pages”) as applied to claims 1-2, 4, 8-9, 11, 15-16, 21-22 and 24 above, in view of **Liu et al.** (Liu hereinafter) (NPL “Derivation of Incremental equations for Nested

Art Unit: 2166

Relations, Database Conference, 2001, ADC 2001, Proceedings 12th Australasian, pp. 76-82").

With respect to claim 3, **Palpanas** teaches **"the method in claim 2, wherein said multiple algebraic function share the same work area when one of"** as the work areas from each partition are then combined into a final work area, and the aggregate function is computed from the final work area. We apply the same algorithms to incrementally maintain these functions for insertions, and similar algorithms can also be used for deletions. The final work area for each of these functions must be kept in the materialized view as an additional, hidden attribute (**Palpanas 4 Using Work Areas**). The examiner interprets the final work area as shared area.

**"said algebraic function"** as a function is algebraic for an operation if the new result of the function, as a result of the operation, can be computed using some small, constant size storage (work area) that accompanies the existing value of the aggregate (**Palpanas 1.1 Classes of Aggregate Functions**).

**Palpanas** discloses the elements of claim 3 as noted above but does not explicitly teach the step of having **"exact match or partial match or an intersection."**

However, **Liu** discloses **"exact match or partial match or an intersection"** as  $R$  be a nested relation schema and  $r$  and  $s$  be two relations over  $R$ . The intersection of  $r$  and  $s$ , denoted by  $r \cap s$ , is a nested relation over  $R$  (**Liu Definition 3.4**). The contained difference of  $r$  and  $s$ , denoted by  $r [-] s$ , is equal to the ordinary set difference  $r - s$  if  $s$  is a subset of  $r$  (**Liu Definition 3.9**). Contained difference gives the partial match.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teaching of the cited references because **Liu's** teaching would have allowed **Palpanas** to provide better performance by using view maintenance algorithm (**Liu Conclusion**) which provides recursive union, difference and intersection operators.

Claims 10, 17 and 23 are same as claim 3, except claim 23 sets forth the claimed invention as a computer program, and are rejected for the same reasons as applied hereinabove.

### ***Response to Arguments***

5. Applicant's arguments filed 6/27/2006 have been fully considered but they are not persuasive.

Applicant argues that **Palpanas et al.** (NPL "Incremental Maintenance for Non-Distributive Aggregate Functions, Proceedings of the 28th VLDB conference, Hong Kong, China, 2002, 12 pages") should be removed as reference because this reference is applicant own work (i.e., the work of the joint inventors, namely, Richard Sidle, Roberta Cochrane, and Hamid Pirahesh).

In response to the preceding arguments, Examiner respectfully submits that, the request for change of inventorship is defective because an amendment cannot remove an inventor from an application. See corrections to inventorship practice, MPEP 201.03 and 37 CFR 1.48 (b).

The affidavit 1.132 filed on 6/27/2006 is ineffective because the applicant has not fulfilled the requirements for attributing the reference to the applicants. In accordance with MPEP 716.10 the applicant must provide evidence that establishes that the subject matter relied on in the reference was derived from the applicant and invented by the applicant. The applicant's declaration must assert invention and facts establishing derivation.

It is also unclear what contributions Themistoklis Palpanas provided to the article, particularly since he did not contribute to the invention. Therefore the reference still qualifies as a prior art under 102 (a).

### ***Conclusion***

6. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the

Art Unit: 2166

shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

### ***Contact Information***

7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Usmaan Saeed whose telephone number is (571)272-4046. The examiner can normally be reached on M-F 8-5.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Hosain Alam can be reached on (571)272-3978. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
